a
LTR divergence signature and genome size
21 species; SVL-adjusted β = 0.31; P = 0.358
Genome size (pg/1C; log scale)
30
20
10
D. valtos
D. wrighti
D. orestes
D. aeneus
5
10
LTR hit bp below 5% divergence (% of all LTR hit bp)
Aquatic eggs
Terrestrial eggs + aquatic larvae
SVL adjusted
Unadjusted
Direct development
b
Conditional association with the TE signature
Same 21 species; fixed regression equations
Genome size | SVL
Cell area | genome + SVL
Nucleus area | cell + genome + SVL
-0.5
0.0
0.5
1.0
Standardized TE coefficient (95% CI)
c
Do cellular associations depend on TE adjustment?
Separate taxon membership from adding the TE score
Genome to cell
Cell to nucleus
Genome to nucleus
-0.5
0.0
0.5
1.0
Standardized cellular coefficient (95% CI)
24 species: SVL
21 species: SVL
21 species: SVL + TE
