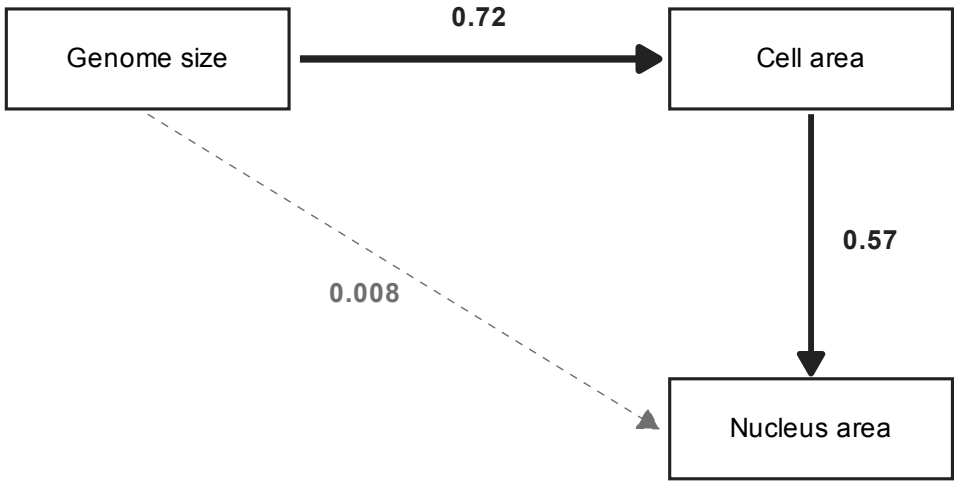
a

Direct and indirect paths among genome, cell and nucleus

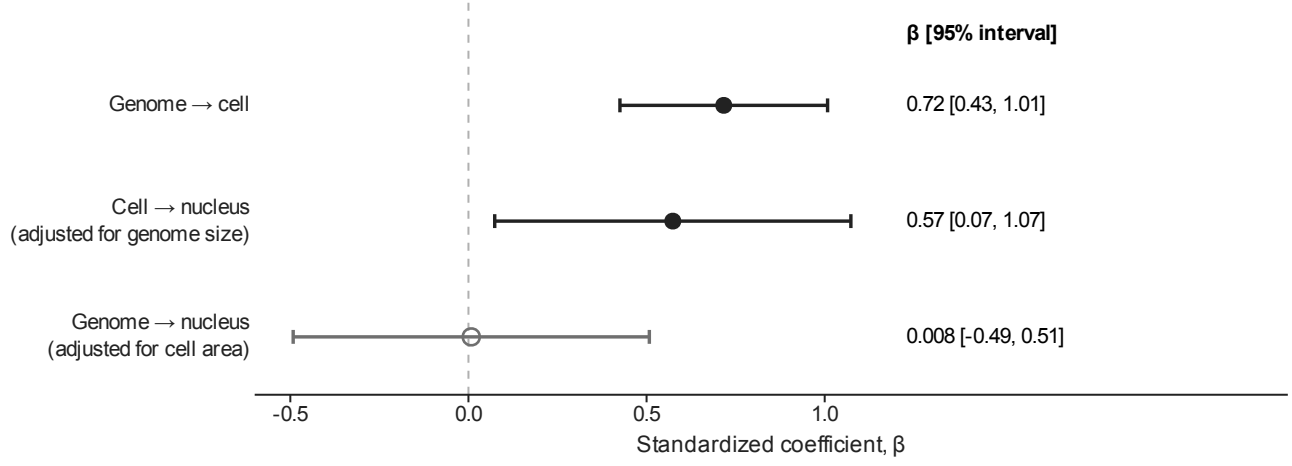
Specified genome-first hypothesis · standardized coefficients · 24 species



Arrow width scales with coefficient magnitude, with a minimum visible width.
Dashed gray path: its 95% interval includes zero. Directions are specified by the hypothesis.

b

Uncertainty in the three displayed paths



Nucleus area is regressed on genome size and cell area together.
Intervals are normal approximations (estimate ± 1.96 SE).
