

Three biological stories, one observational equivalence class

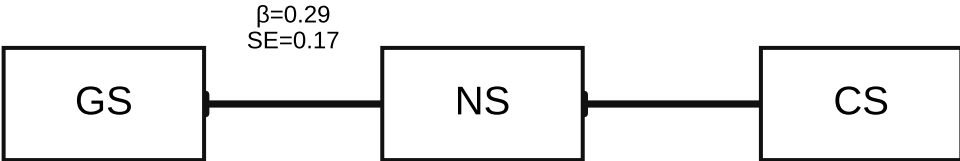

All imply GS independent of CS given NS and therefore receive identical Fisher C, global P, and CICc. Coefficients change orientation only because the arrows were assumed.

Genome → nucleus → cell

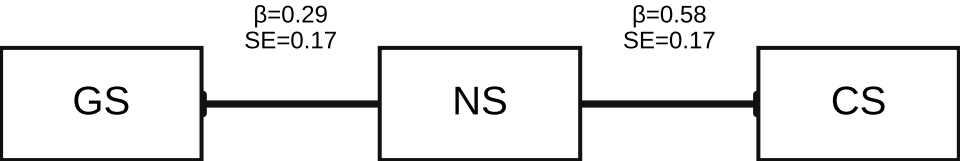

global P=0.001 CICc=27.15
 $\Delta=0.00$ duplicated-set weight=0.333

Cell → nucleus → genome

global P=0.001 CICc=27.15
 $\Delta=0.00$ duplicated-set weight=0.333

Nucleus → genome and cell

global P=0.001 CICc=27.15
 $\Delta=0.00$ duplicated-set weight=0.333

GS, calibrated genome-size estimate; NS, median nucleus area of vetted top-50 cells; CS, median cell area of vetted top-50 cells. Equal 1/3 weights are an artifact of listing the same equivalence class three times.
