

Time-calibrated *Desmognathus* phylogeny with audited bootstrap trait distributions

Size panel: 24 species with all finalized vetted cell–nucleus pairs (n = 8–50 per species). Genome estimates: 24 species; analysis includes all 24. Hollow diamonds mark limited-overlap quality matches; no phylogenetic fills.

Phylogenetically corrected standardized PGLS β : genome–nucleus 0.42; genome–cell 0.72; nucleus–cell 0.58. Panel's λ was estimated by maximum likelihood for each relationship.
